

THE ENECOM PHOTOVOLTAIC PANEL[®]

Light, hard wearing, flexible, unbreakable, recyclable.

The photovoltaic solar panel manufactured by Enecom Italia is completely innovative and original. The mono and polycrystalline solar cells are embedded in a special type of plastic that can even be coloured. This particular process guarantees a high level of efficiency, equal to that of the rigid panels commonly in use. This amazing photovoltaic panel is extremely flexible, very light and completely recyclable.

The technical characteristics of this product enable it to be used on curved surfaces (gazebos, beach umbrellas, bus shelters and street furniture) and on any item that requires flexibility and needs to be hard wearing (in the automobile, nautical and aeronautical fields).

In addition, because the Enecom panel is so light, it can even be used on objects (rucksacks, tents, ski jackets, computer cases and so on) and can provide an autonomous energy source for computers, mp3 readers and mobile phones.

With the panels produced by Enecom the sun helps us even when we are away from home.
